

# **Efficient algorithms for the contextualization of molecular network models**

- 1. Introduction: Network modeling / Systems Biology**
- 2. Specific metabolic network models with fastcore / fastcormics**
- 3. Specific signalling network models with optPBN / Falcon**

**Thomas Sauter**

**System Biology group  
University of Luxembourg**

# “We are witnessing the emergence of the “data rich” era in biology...”

[S. Subramaniam, 2004, Jones, Research Trends, 2010  
Su, sulab.org, 2013;  
Gilbert et al, Stand. Genomic Sci., 2012]

**“The bottleneck ... has shifted from generating the data to interpreting results so as to derive insights into biological mechanisms.”**

**“We cannot understand complex systems without modeling.”**

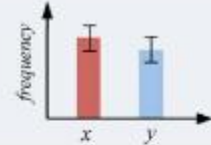

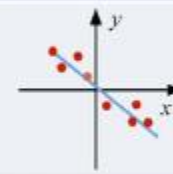

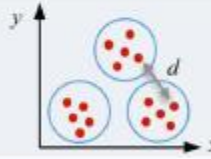

**“The role of the model is to make something complex intelligible or understandable.”**

[O. Wolkenhauer, Front Physiol, 2014, “Why model?”]

# “Why model?”

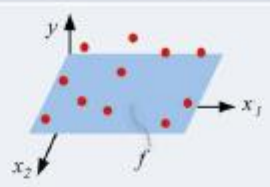

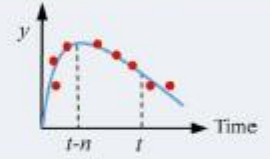

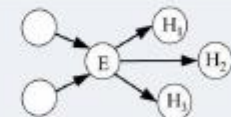

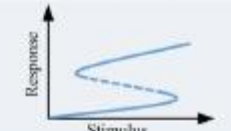

The role of the model is to make something complex intelligible or understandable.”

Testing for differences	Significance Analysis	Is there a difference between the two groups?
“before/after” “with/without”	$95\% \text{ CI} = \bar{X} \pm (t_{(n-1)}(5\%) \times \overline{SE})$	
Analysing covariation	Correlation Analysis	Does a small/large value of $x_i$ coincide with a small/large value of $y$ ?
“coincides with”	$r_{x,y} = \frac{\sum x_i y_i}{\sqrt{\sum x_i^2 \sum y_i^2}}$	
Identifying groups	Cluster/Discriminant Analysis	Can the data be grouped on the basis of features $x$ and $y$ ?
“is similar to”	$D = \min_i \left\{ \min_j \left\{ \frac{d(i,j)}{\max_k d'(k)} \right\} \right\}$	
Condensing data	Component/Factor Analysis	Explain the variability through a weighted linear combination of principal components.
“reduces to”	$X = U \Sigma W^T$	

Ease of experiments

# “Why model?”

The role of the model is to make something complex intelligible or understandable.”

<b>Fitting data</b>	<b>Regression Analysis</b>	What is the predicted value of $y$ , given $x_1$ and $x_2$ ?
“relates to”	$y = f(x_1, \dots, x_n)$	
<b>Numerical predictions</b>	<b>Time Series Analysis</b>	What is the predicted value of $y$ , knowing past values of $y$ ?
“follows”	$y(t) = f(y(t-1), y(t-2), \dots)$	
<b>Analyzing influences</b>	<b>Bayesian (network) Analysis</b>	From the observed evidence, $H_2$ is most probable.
“Given E, the probability of H is”	$P(H_j E) = \frac{\Pr(E H_j)\Pr(H_j)}{\sum \Pr(E H_j)\Pr(H_j)}$	
<b>Investigating mechanisms</b>	<b>Dynamical Systems Theory</b>	The response can be explained by a (bistable) switching mechanism.
“causally entails” “If ... Then ...”	$\frac{d}{dt}x_i = f_i(x_1(t), \dots, x_n(t), u(t))$	

**Power of explanation**

**“Systems biology is the science that studies how biological function emerges from the interactions between the components of living systems and how these emergent properties enable and constrain the behavior of those components.”**

### **Example Network Motif: Function?**

# Systems approach / Function:

Output behavior as a function of input and time

# Output as a function of input and time

**S**

**R**

# Output as a function of input and time

# Output as a function of input and time

# Output as a function of input and time

# Output as a function of input and time

# Output as a function of input and time

# Function:

## Change detection / Adaptation

# Systems approach:

## Second example: Different wiring

**Function: Filter – removes short inputs & act upon long inputs**

# Structure: Feedforward loops

**incoherent:**

**coherent:**

**Functions:**

**Change detection**

**Short input filter**

# Model based Data Integration and Analysis of Disease specific Networks

**Data integration**

**Network analysis**

# Model based Data Integration and Analysis of Disease specific Networks

## Data integration

- Omics data **visualization**
- Metabolic network **reconstruction**
- Signalling network **curation**
- Gene regulatory networks from **epigenetic** data
- **Data mining / machine learning**

 In COBRA toolbox: Nature Protocols, accepted

# Benchmarking of the FASTCORE family

## Criteria:

- computational demands
- accuracy
- Resolution power

**(ability to capture metabolic variations between two context i.e. cell types)**

## Data used:

- Artificial data
- Real data

## Strategies used:

- Comparison to independent references (Human Protein atlas, HepatoNet, etc.)
- Cross-validations
- Functionalities

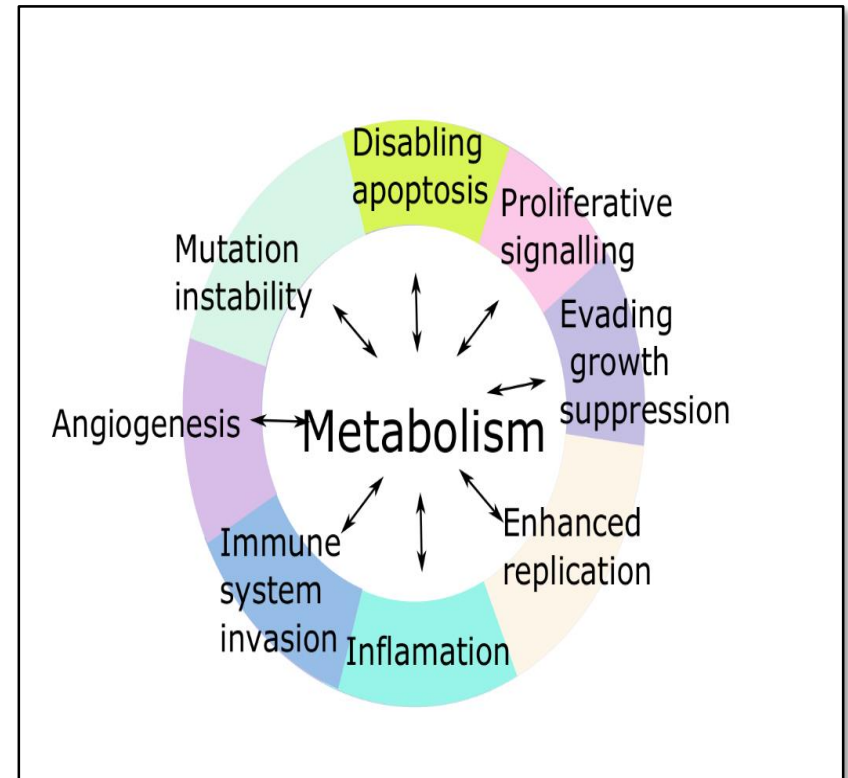

## Benchmarking Procedures for High-Throughput Context Specific Reconstruction Algorithms

# Cancer cells have an altered metabolism that can be targeted

- **Metabolic rewiring affects others hallmarks of cancer**
- **Specifically targeting cancer metabolism allows to reduce toxicity (on other cell types)**

# 10005 models were built using the FASTCORMICS RNA-seq workflow

- TCGA dataset contains 10005 RNA-seq samples across 24 cancer types
- All 10005 models were built in less than 5 days

# FASTCORMICS RNA-seq captures metabolic variation between different cancer types

KICH=Kidney Chromophobe

KIRC= Kidney renal clear cell carcinoma

KIRP=Kidney renal papillary cell carcinoma

# Cancer-cells have a more compact metabolism

Healthy  
core

Cancer  
core

- Cancer cells contain more essential genes  
= more potential drug targets

Percentage of active reactions in a pathway

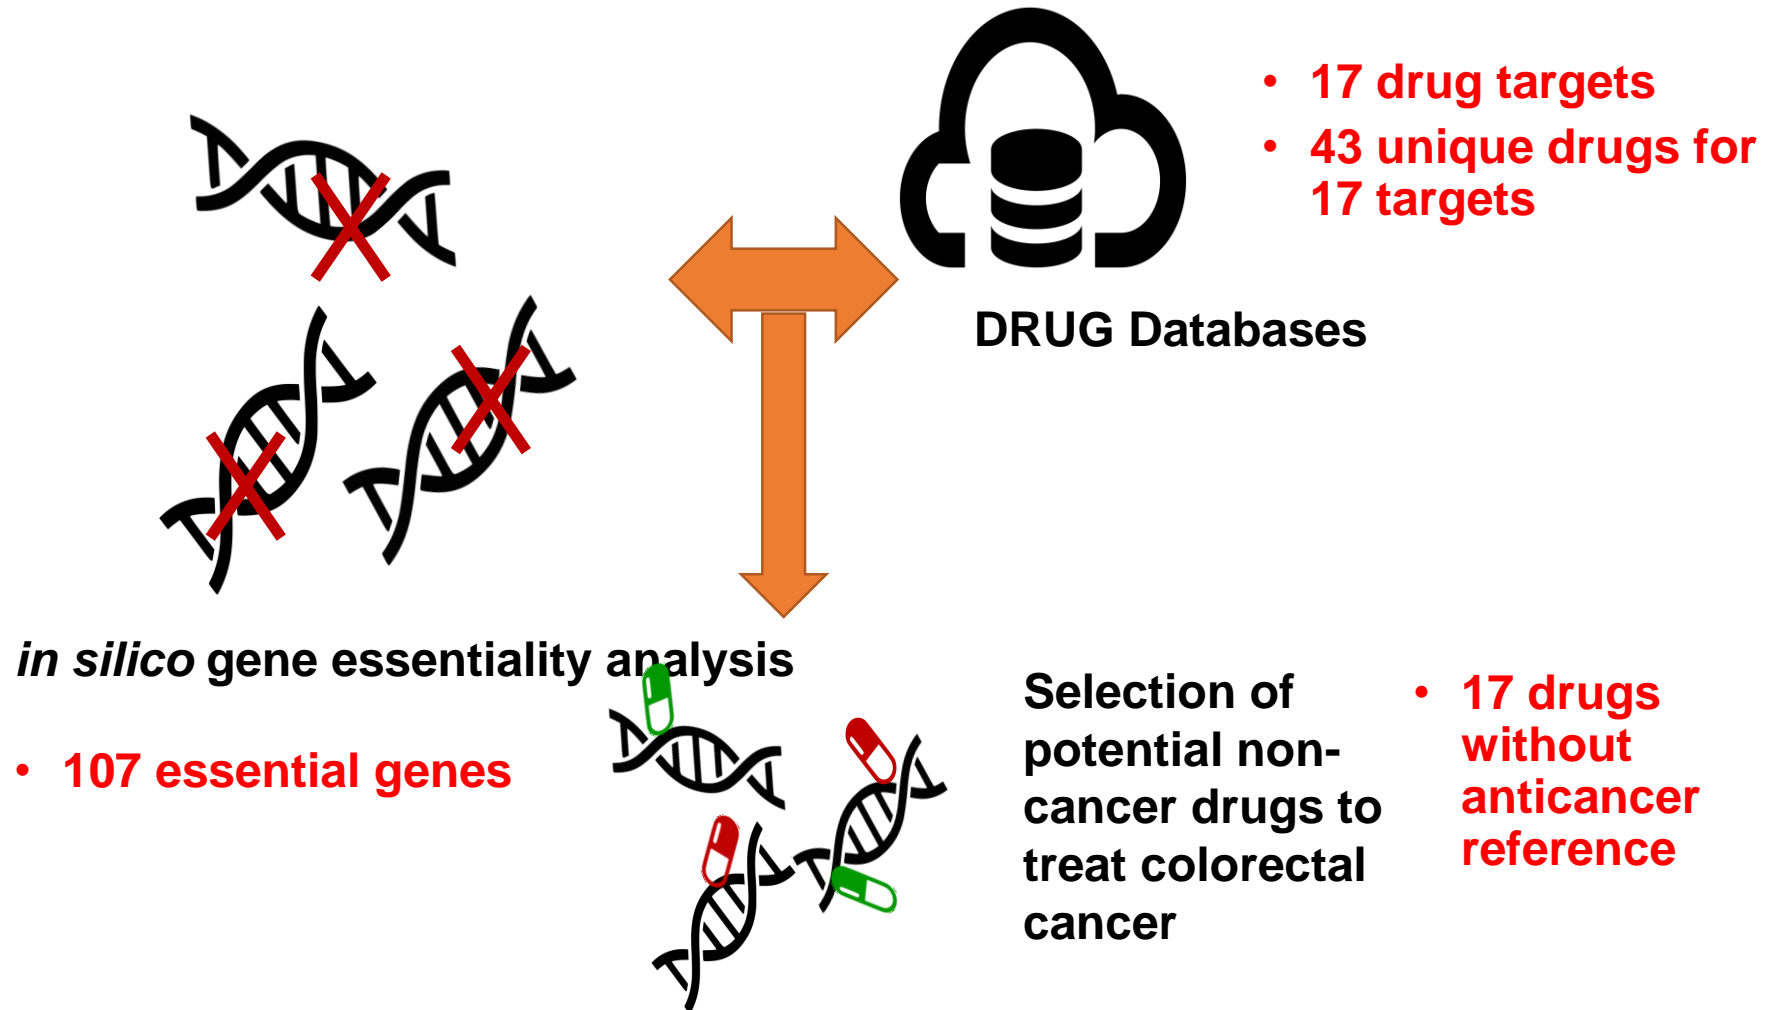

FASTCORMICS RNAseq: Pires Pacheco et al, in preparation

## **Application 2:**

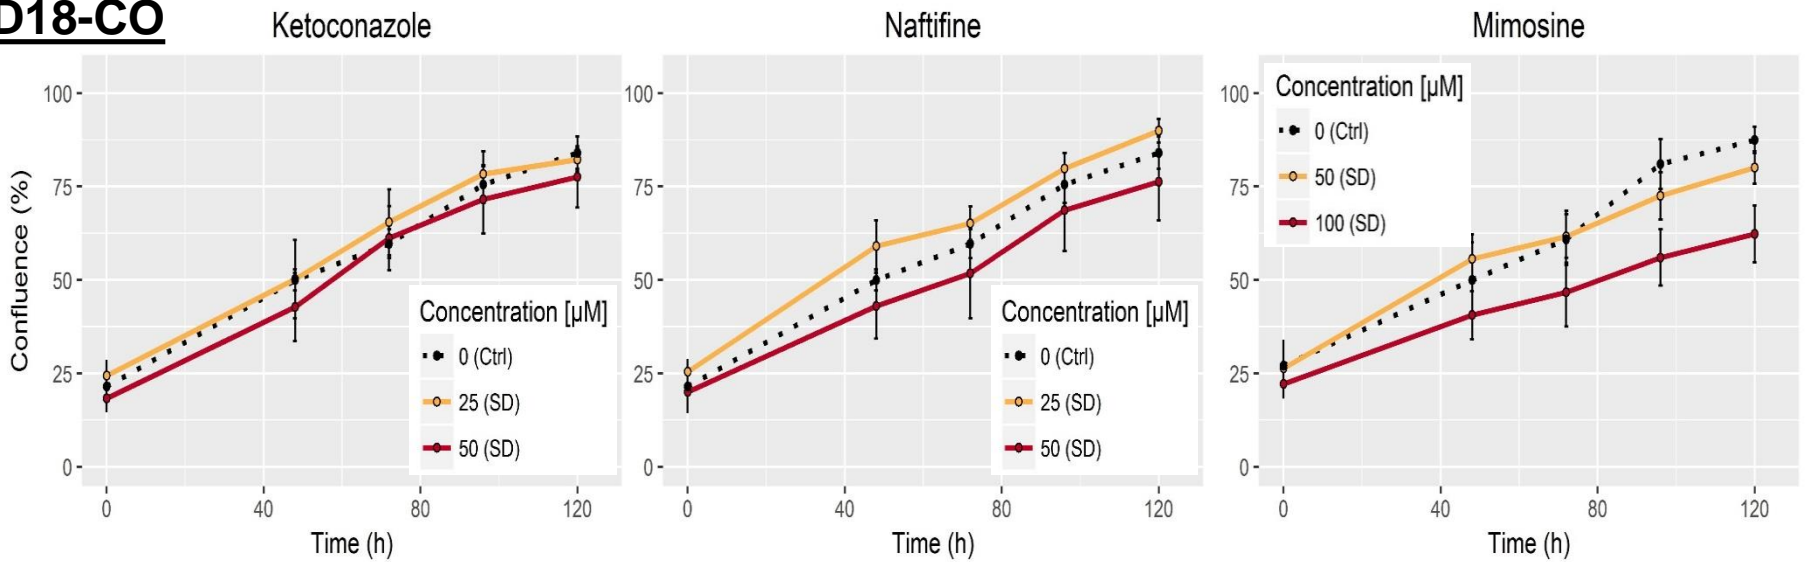

**Identification of potential drug targets for drug repositioning**

# Gene essentiality analysis and datamining to find potential drug targets

# Healthy (CCD18-CO – colonic fibroblast) vs. Cancer (T18 – primary) cells

## CCD18-CO

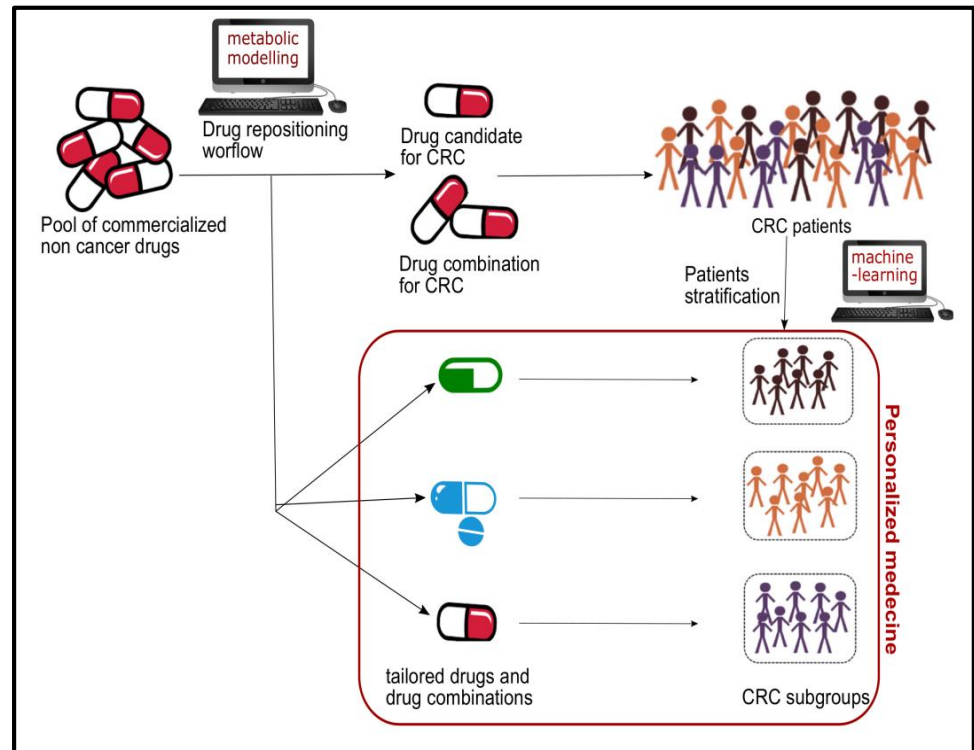

## T18

- 24 hour time interval because of missing time points for CCD18-CO cells
- Graphs show representative experiment in techn. triplicates +/- SD, experiments were repeated 3x (CCD18) and 10x (T18)

# Outlook

- Refine the workflow to capture metabolic variation between patients sub-groups and to predict tailored treatments

**FASTCORE:** Vlassis, Pires Pacheco & Sauter, 2014, Plos Comp Biol  
**FASTCORMICS:** Pires Pacheco et al, 2015, BMC genomics  
**FASTCORMICS RNAseq:** Pires Pacheco et al, in preparation  
**In COBRA toolbox:** Nature Protocols, accepted

# Pipeline Structure: Optimization

# Concept

Biological equivalent	Graphical form	Algebraic computation
Activation	$A \rightarrow Z(k)$	$Z_{t+1} = A_t * k$
Inhibition	$A \dashv Z(k)$	$Z_{t+1} = 1 - (A_t * k)$
Complex formation	$A \text{ AND } B \rightarrow Z(k)$	$Z_{t+1} = A_t * B_t * k$
Competitive interaction	$A \text{ OR } B \rightarrow Z(k)$	$Z_{t+1} = 1 - [(1-A_t) * (1-B_t) * k]$
Non-competitive interaction	$A \rightarrow Z(k_1)$ $B \rightarrow Z(k_2)$	$Z_{t+1} = A_t * k_1 + B_t * k_2$ (with $k_1 + k_2 = 1$ )

$$X_t^{(i)} = \underbrace{\sum_{j_+=1}^m k_{j_+}^{(i)} Pa(X^{(i)})_{t-1}^{(j_+)}}_{\text{Sums of activating signals}} * \left( \underbrace{1 - \sum_{j_-=1}^l k_{j_-}^{(i)} Pa(X^{(i)})_{t-1}^{(j_-)}}_{\text{Sums of inhibiting signals}} \right)$$

Sums of activating signals

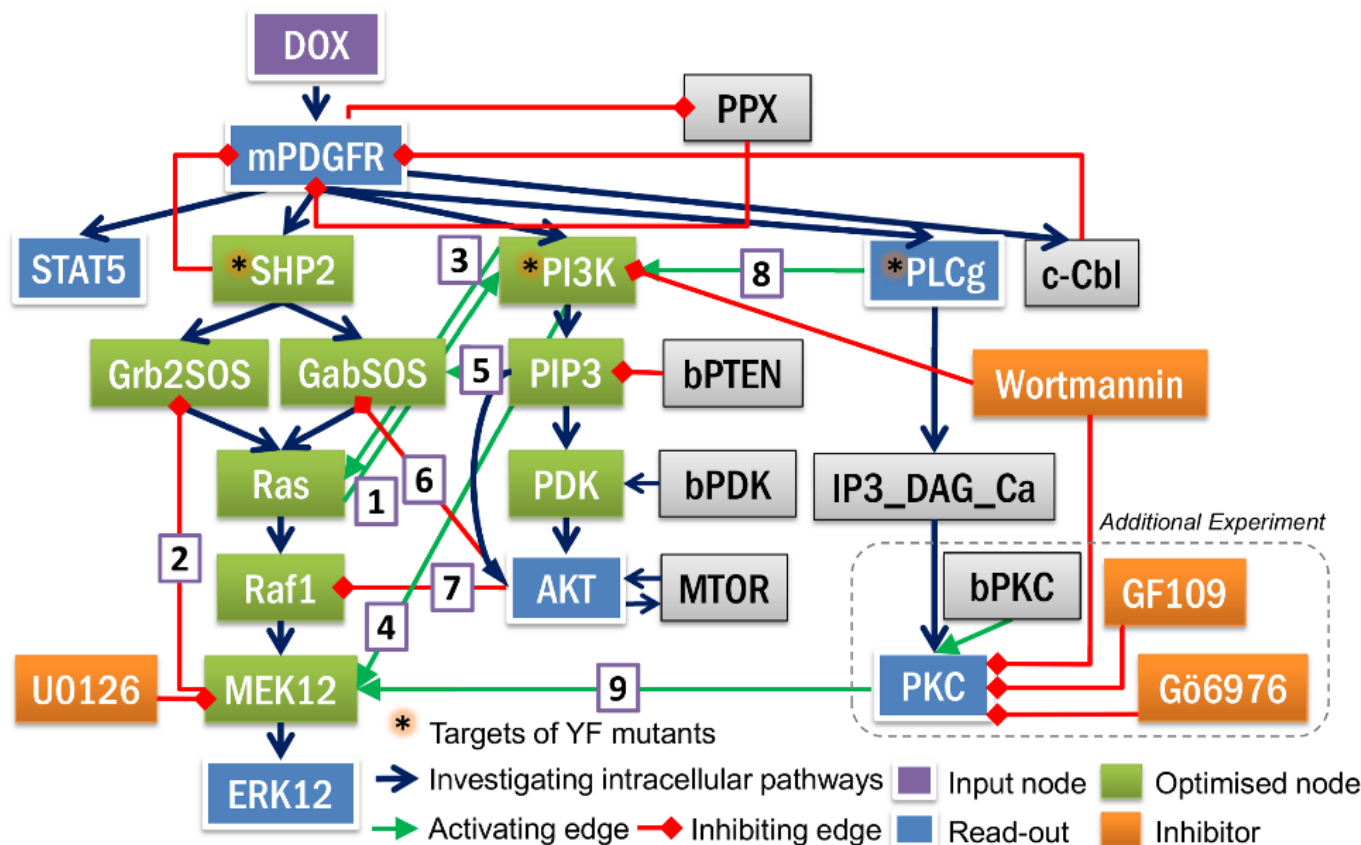

$$\sum_{j_+=1}^m k_{j_+}^{(i)} = 1$$

Sums of inhibiting signals

$$0 \leq \sum_{j_-=1}^l k_{j_-}^{(i)} \leq 1.$$

# FALCON: cancer specific PDGF signalling

With: P. Trairatphisan, M. Wiesinger, S. Haan, J. Pang, A. Mizera

Typical study:

- WB dataset
- Different cell lines
- Different drugs
- Putative cross-talks
- Training on single perturbations
- Predicting combined perturbations

# Discussion & Conclusion FALCON

- ▶ **Our modelling framework is capable of contextualizing logical networks with phosphoproteomics data**
  - Lower fitting costs
  - Very fast
- ▶ **The low computational costs allow for:**
  - Larger networks and big data
  - **Systems Analysis:**
    - Parameter localization
    - Identifiability
    - KO simulations
    - Cell line comparison
